Late glacial and postglacial environmental changes

midcontinent in postglacial times. R. tarandus is documented from the BCF but is known to have been already south of the ice sheets in LGM times. Northward movement of southern grassland-adapted species could have been constrained by forested conditions even further southward on the Great Plains until after the Late-Glacial Maximum.

Latest Pleistocene Vertebrates in Western Canada

Post-glacial marl in Malham Tarn and marl and peat in Tarn Moss overlie Late-glacial clays. Pollen analysis suggests that juniper scrub occupied the limestone upland during the Late-glacial period. In the Post-glacial period this was supplanted by hazel scrub (possibly with pine) and subsequently oak and elm may have been present.

LATE-GLACIAL AND POST-GLACIAL DEPOSITS AT MALHAM

The Late Glacial climate warming (c. 13,000–10,000 years ago), or Tardiglacial ("Late Glacial"), is defined primarily by the beginning of the modern warm period, in which temperatures in the Northern Hemisphere rose substantially, causing a process of accelerated deglaciation following the Last Glacial Maximum (c. 25,000–13,000 years ago).
